Math 341 / 650 Spring 2020 Midterm Examination One

Professor Adam Kapelner Thursday, February 27, 2020

Full Name	
Code of Academic Integrity	
Since the college is an academic community, its fundamental purp to the success of this educational mission is a commitment to the member of the college community is responsible for upholding the Students, as members of the community, are also responsible for a following Code of Academic Integrity. Activities that have the effect or intention of interfering with evaluation of a student's performance are prohibited. Examples of to the following definitions:	highest standards of honesty at all times, adhering to the principles and spirit of the deducation, pursuit of knowledge, or fair
Cheating Using or attempting to use unauthorized assistance or other academic work or preventing, or attempting to prevent, a material, or study aids. Example: using an unauthorized cheat slexam and resubmitting it for a better grade, etc.	another from using authorized assistance.
acknowledge and agree to uphold this Code of Academic Integrit	y.
signature	date

Instructions

This exam is seventy five minutes and closed-book. You are allowed **one** page (front and back) of a "cheat sheet." You may use a graphing calculator of your choice. Please read the questions carefully. If the question reads "compute," this means the solution will be a number otherwise you can leave the answer in any widely accepted mathematical notation which could be resolved to an exact or approximate number with the use of a computer. I advise you to skip problems marked "[Extra Credit]" until you have finished the other questions on the exam, then loop back. I also advise you to use pencil. The exam is 100 points total plus extra credit. Partial credit will be granted for incomplete answers on most of the questions. Box in your final answers. NO FOOD but drinks okay. Good luck!

Distribution	Quantile	PMF / PDF	CDF	Sampling
of r.v.	Function	function	function	Function
beta	$qbeta(p, \alpha, \beta)$	$d-(x, \alpha, \beta)$	$p-(x, \alpha, \beta)$	$r-(\alpha, \beta)$
betabinomial	$qbetabinom(p, n, \alpha, \beta)$	d - (x, n, α, β)	$p-(x, n, \alpha, \beta)$	$r-(n, \alpha, \beta)$
betanegativebinomial	qbeta_nbinom (p, r, α, β)	d - (x, r, α, β)	$p-(x, r, \alpha, \beta)$	\mathbf{r} - (r, α, β)
binomial	$q exttt{binom}(p, n, \theta)$	$d^-(x, n, \theta)$	$p^-(x, n, \theta)$	$r-(n, \theta)$
exponential	$qexp(p, \theta)$	$d-(x, \theta)$	$p-(x, \theta)$	$r^{\perp}(\theta)$
gamma	$qgamma(p, \alpha, \beta)$	$d-(x, \alpha, \beta)$	$p-(x, \alpha, \beta)$	$r^{-}(\alpha, \beta)$
geometric	$qgeom(p, \theta)$	$d-(x, \theta)$	$p-(x, \theta)$	$r-(\theta)$
inversegamma	$\mathtt{qinvgamma}(p, lpha, eta)$	$d-(x, \alpha, \beta)$	$p^-(x, \alpha, \beta)$	$r-(\alpha, \beta)$
negative-binomial	$\mathtt{qnbinom}(p,r, heta)$	$d-(x, r, \theta)$	$p^-(x, r, \theta)$	$r-(r, \theta)$
normal (univariate)	$\mathtt{qnorm}(p, heta,\sigma)$	$d-(x, \theta, \sigma)$	$p-(x, \theta, \sigma)$	$r-(\theta, \sigma)$
poisson	$ exttt{qpois}(p, heta)$	$d-(x, \theta)$	$p-(x, \theta)$	$r-(\theta)$
T (standard)	$\operatorname{qt}(p, u)$	$d-(x, \nu)$	$p-(x, \nu)$	r- (u)
uniform	$\mathtt{qunif}(p,a,b)$	d-(x, a, b)	p-(x, a, b)	r-(a, b)

Table 1: Functions from R (in alphabetical order) that can be used on this exam with their arguments. The hyphen in column 3, 4 and 5 is shorthand notation for the full text of the r.v. which can be found in column 2.

Problem 1 Let \mathcal{F} be binomial with known sample size n=3. The data is all "successes" i.e. x=3. For all questions that have numerical answers, use three significant digits e.g. 0.123 and 1.23×10^{-5} or fractions.

- (a) [2 pt / 2 pts] Find the maximum likelihood estimate for θ . $\bar{\chi} = \frac{3}{3} = 1 = \delta_{\text{max}}$
- (b) [4 pt / 6 pts] What is the main problem with your estimate in (a)?

It implies that a realization of O is impossible. This is imprehent to say after only seeing n=3 observations!

- (c) [3 pt / 9 pts] Find the $CI_{\theta,99\%}$.
- (d) [4 pt / 13 pts] Does the interval in (c) fulfill the second goal of statistical inference? Yes / no and explain your answer.

No. The second goal of intermee (confidence sea) is no provide a set of possible likely influed of D. This sea only has one influe in it! And who value is problemente as me personal in (b).

(e) [2 pt / 15 pts] We will now conduct Bayesian inference. Consider the reduced parameter space $\Theta_0 = \{0.50, 0.99\} \subset \Theta = (0, 1)$. We believe strongly in $\theta = 0.5$ but we want to give some credence to the alternate theory. Thus we establish a prior of

$$\mathbb{P}(\theta) = \begin{cases} 0.50 & \text{w.p. } 0.9\\ 0.99 & \text{w.p. } 0.1 \end{cases}$$

Is this the "prior of indifference" for the reduced parameter space? Yes / no and explain.

No. The prior of indifference is Or U(50.5,0.893)

(f) [5 pt / 20 pts] Find $\hat{\theta}_{MAP}$.

$$P(x=3 \mid 0=0.5) P(0=0.5) = (\frac{1}{2})^3 0.9 = 0.1125$$

 $P(x=3 \mid 0=0.91) P(0=0.91) = 0.993.0.1 = (0.0770) > 0.000 = 0.55$

(g) [5 pt / 25 pts] Find $\mathbb{P}(X = x)$.

0.210

(h) [5 pt / 30 pts] Find the posterior predictive probability $\mathbb{P}(X_* = 1 \mid X = x)$ where X_* denotes the next observation.

$$P(X_{x}=1 \mid X=3) = \sum_{O \in \mathcal{D}_{x}} P(X_{x}^{-}|O) \mathcal{L}O(X_{x}) = \frac{1}{P(X=3)} \sum_{O \in \mathcal{D}_{x}} P(X_{x}^{-}|O) \mathcal{L}O(X_{x}^{-}|O) P(O)$$

$$= \frac{1}{0.310} \left(0.5.0.1125 + 0.93.0.0870 \right) = 0.727$$

(i) [3 pt / 33 pts] We will now consider the entire parameter space for the binomial model i.e. $\Theta = (0,1)$. We will use the prior $\theta \sim \text{Beta}\left(\frac{1}{2},\frac{1}{2}\right)$. We will see later in class that this is called the "Jeffrey's Prior". Is this an uninformative prior? Yes / no and explain.

Yes, ho=\frac{1}{2} + \frac{1}{2} = 1 which is not a lot of prior data. There,
this prior is 4histornaire.

(j) [2 pt / 35 pts] Is this the "prior of indifference"? Yes / no and explain.

No. The prior of indefence is Or U(1) = Beta (1,1).

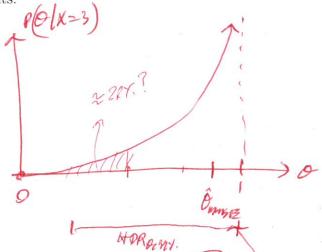

(k) [2 pt / 37 pts] How many pseudosuccesses and pseudofailures is within this prior?

0.5 prendrencesses ent 0.5 prendofideper.

- (1) [3 pt / 40 pts] What is $\mathbb{E}[\theta]$? $0.5 = \frac{1}{2r+\frac{1}{2}}$
- (m) [5 pt / 45 pts] Find $\mathbb{P}(\theta \mid X = x)$.

PO(X) = Beta (x+x, B+4-x), PO(X=3) = Beta (3.5,0.5)

(n) [6 pt / 51 pts] Draw $\mathbb{P}(\theta \mid X = x)$ to the best of your ability. Label all axes and critical points.

(o) [2 pt / 53 pts] Does $\hat{\theta}_{MAP}$ exist? Yes / No.

(p) [4 pt / 57 pts] Find $\hat{\theta}_{\text{MMSE}}$ and denote it in the illustration in (n).

Emme = 3.5 35+05 = 0.875 4 (q) [4 pt / 61 pts] What is the proportion of shrinkage towards the prior expectation if you employ the posterior expectation as your point estimate?

(r) [5 pt / 66 pts] Find the $CR_{\theta,99\%}$.

(s) [5 pt / 71 pts] Find the $HDR_{\theta,99\%}$ and denote it in the illustration in (n).

(t) [10 pt / 81 pts] Test if $\theta > 0.5$. Write out the hypotheses and declare the α level you are comfortable with. Estimate the Bayesian p-value from the illustration of the posterior distribution in (n) and provide the conclusion of the test.

$$from = P(Ho|X) = P(0 \le 0.5 | X = 3) = pletu(0.5, 3.5, 0.5) \approx 20\% \Rightarrow Fail to reject Ho.$$
There is no compelling evidence to suggest $0 > 0.5$

(u) [4 pt / 85 pts] Find the posterior predictive distribution $\mathbb{P}(X_* = 1 \mid X = x)$ where X_* denotes the next observation.

(v) [3 pt / 88 pts] What is your best guess of X_* ?

Problem 2 Consider $X_1, \ldots, X_n \stackrel{iid}{\sim} \text{Beta}(1, \theta)$.

(a) [6 pt / 94 pts] Find $\mathcal{L}(\theta; X_1, \dots, X_n)$. Simplify so that your answer does not include the $B(\cdot, \cdot)$ function or the $\Gamma(\cdot)$ function.

 $f(0; x) = \prod_{i \ge 1} \frac{1}{6(i \cdot e)} x_i^{(l+1)} (-x_i)^{0-1} = \prod_{i \ge 1} O(-x_i)^{0-1} = O^{\frac{1}{2}} \prod_{i \ge 1} (-x_i)^{0-1}$ $\overline{f(0)} = \frac{\Gamma(1 \cdot e)}{\Gamma(0) \Gamma(0)} = \frac{O \Gamma(0)}{\Gamma(0)} = 0$

(b) [3 pt / 97 pts] Find $\ell(\theta; X_1, \dots, X_n)$. Simplify as much as possible.

l(0:x) = 4 ln(0) + (0-1) Eln(1-xi) = 4 ln(0) + 0 Eln(1-xi) - Eln(1-xi)

(c) [3 pt / 100 pts] Find $\hat{\theta}_{MLE}$.

 $l'(\theta; x) = \frac{h}{\theta} + \frac{h}{\epsilon} l_{x}(l-x_{i}) \stackrel{\text{det}}{=} 0 \Rightarrow \partial_{xx} = -\frac{h}{\epsilon} l_{x}(l-x_{i})$

(d) [8 pt / 108 pts] [Extra Credit] Consider $X_1, \ldots, X_n \stackrel{iid}{\sim} \text{Beta}(\theta_1, \theta_2)$. Find the MLE for θ_1 and the MLE for θ_2 . Partial credit is given.
